Cryptographic observability feature policies
Legitimate metadata is separated from target leakage and sensitive raw identifiers
Hard leakage and sensitive raw fields
label
attack category
scenario
source file
raw IP identity
exact timestamp
client ID
username/password
payload/topic strings
removed before model training
audit
Full audited metadata
upper-bound metadata after hard leakage removal
Broker-side secure metadata
broker/flow attributes without raw content or credentials
Strict encrypted-flow metadata
duration, packets, bytes, IAT, rates, burstiness, TCP flags
duration
pkt count
bytes
IAT
rates
burst
TCP flags
Policy logic
F_main = X minus H
F_cons = F_main minus S
F_common = semantic intersection
High single-feature predictiveness alone is not treated as leakage.
